Restriction enzyme practice problems and answers

Restriction enzyme practice problems and answers are invaluable tools for students and researchers working in molecular biology and genetics. These practice problems help reinforce understanding of how restriction enzymes recognize specific DNA sequences and cut DNA at particular sites, which is fundamental for genetic cloning, DNA mapping, and various biotechnological applications. This article provides a comprehensive collection of restriction enzyme practice problems along with detailed solutions to enhance learning and mastery of this essential topic.

Understanding Restriction Enzymes

What Are Restriction Enzymes?

Restriction enzymes, also known as restriction endonucleases, are proteins naturally produced by bacteria as a defense mechanism against invading viral DNA. They recognize specific, short DNA sequences called recognition sites and cleave the DNA at or near these sites. In laboratory settings, restriction enzymes are used to manipulate DNA in precise ways, enabling scientists to cut and paste DNA fragments.

How Do Restriction Enzymes Work?

Most restriction enzymes recognize palindromic sequences—sequences that read the same forward and backward on complementary strands. Once the enzyme identifies its recognition site, it cuts the DNA, producing either sticky (cohesive) ends or blunt ends, depending on the enzyme.

Types of Restriction Enzymes

Type I: Recognize specific sequences but cut at random sites far from recognition sites.
Type II: Recognize specific sequences and cut within or near these sites; most commonly used in labs.
Type III: Recognize specific sequences and cut a short distance away.

Practice Problems on Restriction Enzymes

Problem 1: Identifying Recognition Sites

Given the following DNA sequence, identify the recognition site for EcoRI and indicate where the enzyme would cut:
DNA sequence: 5' - GAATTCGAGCTC - 3'

Solution: EcoRI recognizes the palindromic sequence 5'-GAATTC-3'. In the provided sequence, the recognition site appears at positions 1-6. The cut site for EcoRI is between G and A on the top strand: 5'-G | AATTC-3' and correspondingly between T and C on the bottom strand: 3'-CTTAAG-5'.

Answer: EcoRI recognizes the sequence 5'-GAATTC-3' at positions 1-6 and cuts between G and A, producing sticky ends with 5' overhangs.

Problem 2: Determining Fragment Sizes after Digestion

You have a 10 kb plasmid DNA. When digested with EcoRI, it produces two fragments of 4 kb and 6 kb. Draw the plasmid map indicating the location of the EcoRI recognition sites.

Solution: Since digestion yields two fragments, there are two EcoRI sites on the plasmid. The sum of the fragment sizes (4 kb + 6 kb) equals the total plasmid size (10 kb). The EcoRI sites are located such that:
Fragment 1: 0 to 4 kb
Fragment 2: 4 kb to 10 kb
The recognition sites are positioned accordingly, with distances between them reflecting the fragment sizes.

Answer: The plasmid contains two EcoRI recognition sites separated by 4 kb and 6 kb along its circular DNA, dividing the plasmid into two fragments upon digestion.

Problem 3: Predicting DNA Fragment Patterns

A DNA sample is digested with two enzymes: EcoRI and HindIII. The individual digests produce the following fragment sizes:
EcoRI digest: 3 kb, 2 kb, 1 kb, 4 kb
HindIII digest: 5 kb, 3 kb, 2 kb

When both enzymes are used together, what fragment sizes would you expect? Assume the enzymes cut at different sites, and the DNA is linear.

Solution: To predict combined digestion patterns, consider the cuts:
The EcoRI sites produce the 3 kb, 2 kb, 1 kb, and 4 kb fragments.
The HindIII sites produce the 5 kb, 3 kb, and 2 kb fragments.
Since both enzymes cut at different sites,

the pattern of combined digestion will produce smaller fragments resulting from overlapping cuts. Suppose the original DNA is linear and contains recognition sites for both enzymes at specific positions. The combined digestion will generate fragments that are intersections of EcoRI and HindIII cuts. Expected fragment sizes could include: 1 kb (from overlapping cuts) 2 kb 3 kb 4 kb 5 kb. Smaller fragments resulting from combined cuts, such as 1 kb + 2 kb (i.e., 3 kb), etc.

Answer: The combined digestion will produce a mixture of fragments, including sizes like 1 kb, 2 kb, 3 kb, 4 kb, and 5 kb, with some fragments possibly overlapping or smaller due to multiple cuts within the original DNA.

Additional Practice Problems and Solutions

Problem 4: Designing a Cloning Strategy
You want to clone a gene into a plasmid vector. The gene has EcoRI and BamHI sites flanking it. The vector has a single EcoRI site and a single BamHI site. How would you design the restriction enzyme digestion to insert your gene into the vector?

Solution: To insert the gene into the vector, you need to generate compatible sticky ends on both the gene and the vector: Digest the gene with EcoRI and BamHI to produce sticky ends. Digest the vector with EcoRI and BamHI to produce compatible sticky ends. Ligate the gene into the vector using DNA ligase. This strategy ensures correct orientation and efficient cloning.

Answer: Perform double digestion of the gene and vector with EcoRI and BamHI, then ligate the gene into the vector, resulting in a recombinant plasmid with the gene inserted at the desired site.

Problem 5: Recognizing Restriction Sites in a DNA Sequence
Identify all EcoRI, HindIII, and BamHI sites in the following DNA sequence: 5'-AATTGAATTCGAGCTCGGATCCGCGGATCC-3'

Solution: Look for recognition sequences:
EcoRI: GAATTC
HindIII: AAGCTT
BamHI: GGATCC

Sequence analysis:
EcoRI site: GAATTC appears at positions 5-10: 5'-AATTGAATTCG-3'
HindIII site: GAGCTC at positions 12-17? No, GAGCTC is not present; GAGCTC is the HindIII site, but not in this sequence.
BamHI site: GGATCC appears at positions 20-25: GGATCC.

Answer: EcoRI site at positions 5-10 (GAATTC) BamHI site at positions 20-25 (GGATCC) No HindIII site present in this sequence.

Tips for Solving Restriction Enzyme Problems
Memorize common recognition sites: Knowing the sequences for EcoRI, HindIII, BamHI, and others helps quickly identify sites. Practice reading palindromic sequences: Recognize palindromic DNA sequences as restriction sites. Understand enzyme cut patterns: Sticky vs. blunt ends influence cloning strategies. Use maps and diagrams: Visual representations help in understanding fragment sizes and enzyme sites. Verify your answers: Double-check that the sum of fragment sizes equals the original DNA size.

Sample Practice Problems and Solutions

Below are some illustrative examples illustrating the variety and depth of restriction enzyme practice problems.

Problem 1: Recognition Site Identification

Question: Given the DNA sequence 5'-AAGCTTGAATTC-3', identify all restriction sites for EcoRI and HindIII.

Answer: EcoRI recognizes the sequence 5'-GAATTC-3' and cuts between G and A. HindIII recognizes 5'-AAGCTT-3' and cuts between A and A. In the provided sequence: EcoRI recognition site: 5'-GAATTC-3' appears starting at position 7 (assuming 1-based indexing). HindIII recognition site: 5'-AAGCTT-3' appears at positions 1-6.

Conclusion: The sequence contains both EcoRI and HindIII sites at positions 1-6 and 7-12, respectively.

Problem 2: Predicting Fragment Sizes

Question: A circular plasmid of 5,000 base pairs contains one EcoRI site at 500 bp and another at 3,000 bp. If the plasmid is cut with EcoRI, what are the sizes of the resulting

fragments? Answer: Since the plasmid is circular, cutting at two sites yields two linear fragments: Fragment 1: from 500 bp to 3,000 bp Size = $3,000 - 500 = 2,500$ bp Fragment 2: remaining part of the circle: $5,000 - 2,500 = 2,500$ bp Result: Two fragments, each 2,500 bp.

Problem 3: Designing a Cloning Strategy

Question: You want to clone a gene of interest into a plasmid vector. The gene's ends are known to contain EcoRI and HindIII sites. How would you plan the restriction digestion and ligation steps?

Answer: Digest the vector and insert with EcoRI and HindIII to generate compatible sticky ends. Purify the digested DNA fragments to remove enzymes and buffer components. Set up ligation using T4 DNA ligase, mixing the digested insert and vector in optimal molar ratios (commonly 3:1 insert to vector). Transform competent cells with the ligation mixture, then select for successful clones.

Additional considerations: Ensure the vector has a multiple cloning site (MCS) with EcoRI and HindIII sites available. Confirm the insert does not contain internal EcoRI or HindIII sites to prevent unwanted cuts. Run control reactions to verify digestion efficiency.
